Polaris MVP - GitHub Repository Blueprint

Based on the Zero -> Memory -> Evolution -> Infinity architecture.

Vision

```
Build an evolutionary agentic software engineer that generates multiple software solutions, evaluates
```

MVP Goals

```
1. Population of coding agents. 2. Genome-driven prompting. 3. LLM-generated solutions. 4. Automated
```

Repository Structure

```

```

Core Components

```
Agents generate solutions. Memory stores outcomes. Evaluation scores candidates. Evolution selects wi
```

Genome Model

```
class Genome:
    creativity:int
    planning:int
    testing:int
    optimization:int
```

Evolution Loop

```
Observe -> Generate -> Test -> Score -> Select -> Mutate -> Store Memory -> Repeat
```

Phase Roadmap

```
Phase 1: Single agent. Phase 2: Population. Phase 3: Evolution. Phase 4: Reality Search. Phase 5: Se
```

Minimal Working Prototype Summary

The MVP demonstrates evolutionary software engineering using multiple LLM-generated solutions, fitness scoring, mutation, crossover, memory persistence, and benchmark-driven selection.
